GASPI Tutorial Questionnaire

https://www.surveymonkey.co.uk/r/RPH2333

INTERTWinE - Programming Model INTERoperability ToWards Exascale

Round of Introductions

- Who are you?
- What are you doing?
- How did you get in contact with GASPI?
- What is your interest in / expectation to GASPI?

Goals

- Get an overview over GASPI
- Learn how to
 - Compile a GASPI program
 - Execute a GASPI program
- Get used to the GASPI programming model
 - one-sided communication
 - weak synchronization
 - asynchronous patterns / dataflow implementations

Outline

- Introduction to GASPI
- GASPI API
 - Execution model
 - Memory segments
 - One-sided communication
 - Collectives
 - Passive communication

Outline

- GASPI programming model
 - Dataflow model
 - Fault tolerance

www.gaspi.de

www.gpi-site.com

Introduction to GASPI

GASPI at a Glance

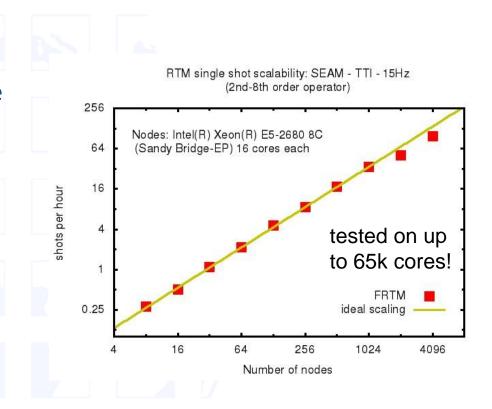

GASPI at a Glance

Features:

- Global partitioned address space
- Asynchronous, one-sided communication
- Threadsave, every thread can communicate
- Supports fault tolerance
- Open Source
- Standardized API (GASPI)

Infiniband, Cray, Ethernet, GPUs, Intel Xeon Phi, Open Source (GPL), standardized API

GASPI History

- GPI is the implementation of the GASPI standard
 - originally called Fraunhofer Virtual Machine (FVM)
 - developed since 2005
 - used in many of the industry projects at CC-HPC of Fraunhofer ITWM

Winner of the "Joseph von Fraunhofer Preis 2013" Finalist of the "European Innovation Radar 2016".

Concepts: Communication

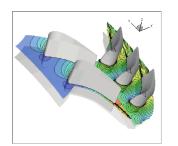

Concepts: One-Sided Communication

- One-sided operations between parallel processes include remote reads and writes
- Data can be accessed without participation of the remote site
- The initiator specifies all parameters
 - Source location
 - Target location
 - Message size

- Data can be accessed without participation of the remote site.
- Remote sides have to know about designated communication area(s) before hand
- Designated communication areas in GASPI are called segments

Node 1

Segment 1

Segment 2

Node 2

Segment 1

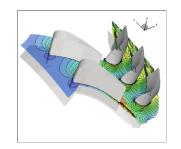

Segment 2

Segment 3

Segment 4

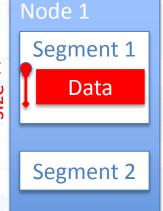

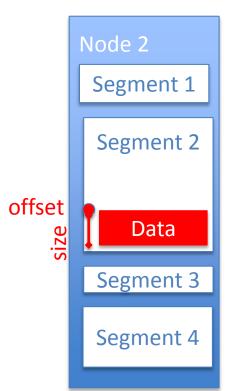

offset ozis ozis

Application has to manage data transfer completely:

 Specify which part of the segment will be transferred (offset and size)

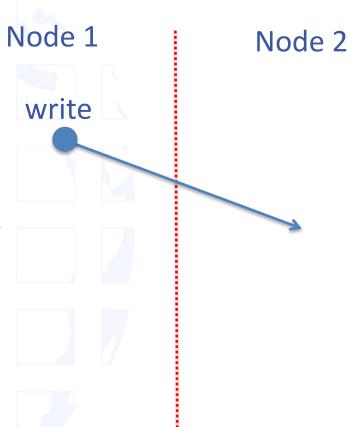

Concepts: one-sided Communication

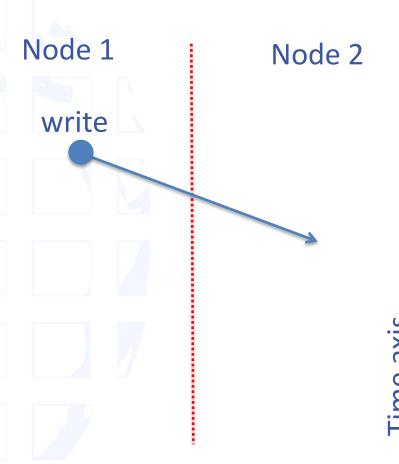

- One-sided operations between parallel processes include remote reads and writes.
- Data can be accessed without participation of the remote site.
- One-sided communication is nonblocking: communication is triggered but may not be finished

Concepts: one-sided Communication

 Node 2 has not participated, it does not know that communication has started

Concepts: Synchronisation with Notifications

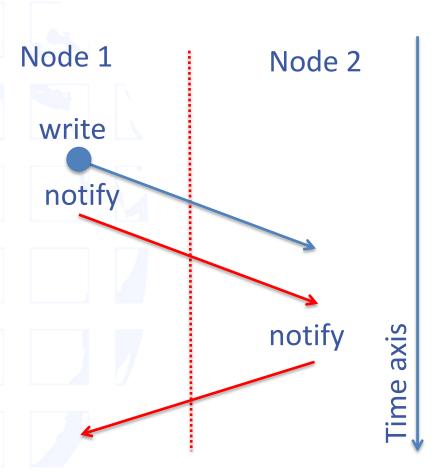

- Node 2 has not participated, it does not know that communication has started
- It has to be notified.

Concepts: Synchronisation with Notifications

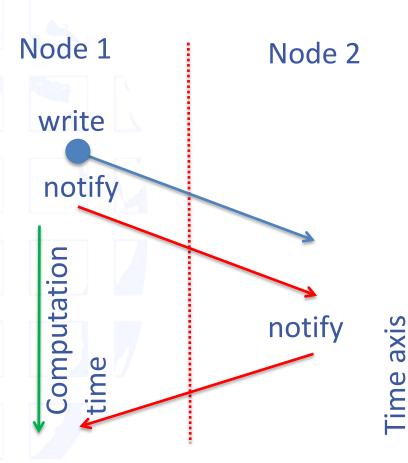

- Node 2 has not participated, it does not know that communication has started
- It has to be notified for data movement completion.
- Node 1 does not know if the write has finished.
- If it needs to know, it also has to be notified

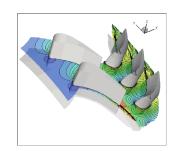

Concepts: overlap of Communication and Computation

- Due to the non-blocking nature of the call Node 1 has gained some computation time which it can use
- Communication and computation happen in parallel
- Communication latency is hidden

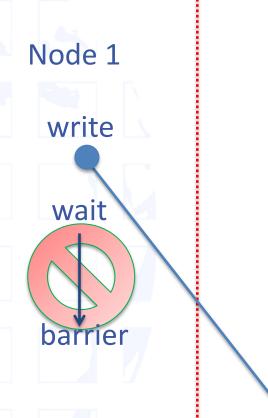

Concepts: Warning!

- Data synchronisation by wait
 + barrier does not work!
- Wait does wait on local queue on Node 1, does not know about write in Node 2, barrier() has no relation with communication
- Data synchronization only by notifications

Node 2

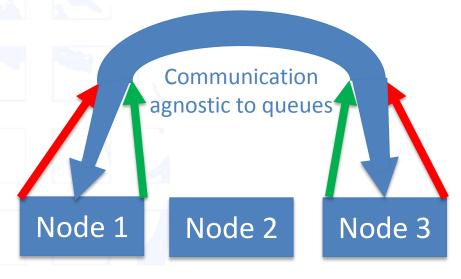

barrier

Time axis

Concepts: Communication Queues

- Communication requests are posted to queues
- Queues are a local concept!
- Used to separate concerns between different parts of the applications
- Queues are used in order to establish the synchronization context.

Queue 1: e.g. used by main app.

Queue 2: e.g. used by library

Incoming data agnostic of queue

The GASPI API

- 52 communication functions
- 24 getter/setter functions
- 108 pages
 - ... but in reality:
 - Init/Term
 - Segments
 - Read/Write
 - Passive Communication
 - Global Atomic Operations
 - Groups and collectives

```
GASPI_WRITE_NOTIFY ( segment_id_local , offset_local , rank , segment_id_remote , offset_remote , size , notification_id , notification_value , queue , timeout )
```

Parameter:

- (in) segment id local: the local segment ID to read from
- (in) offset local: the local offset in bytes to read from
- (in) rank: the remote rank to write to
- (in) segment_id_remote: the remote segment to write to
- (in) offset_remote: the remote offset to write to
- (in) size: the size of the data to write
- (in) notification_id: the remote notification ID
- (in) notification value: the value of the notification to write
- (in) queue: the queue to use
- (in) timeout: the timeout

www.gaspi.de

GASPI Execution Model

- SPMD / MPMD execution model
- All procedures have prefix gaspi_

```
gaspi_return_t
gaspi_proc_init ( gaspi_timeout_t const timeout )
```

- All procedures have a return value
- Timeout mechanism for potentially blocking procedures

GASPI Return Values

- Procedure return values:
 - GASPI_SUCCESS
 - designated operation successfully completed
 - GASPI_TIMEOUT
 - designated operation could not be finished in the given time
 - not necessarily an error
 - the procedure has to be invoked subsequently in order to fully complete the designated operation
 - GASPI_QUEUE_FULL
 - Request could not be posted to queue. End of queue has been reached, change queue or wait
 - GASPI_ERROR
 - designated operation failed -> check error vector
- Advice: Always check return value!

success_or_die.h

```
#ifndef SUCCESS OR DIE H
#define SUCCESS OR DIE H
#include <GASPI.h>
#include <stdlib.h>
#define SUCCESS OR DIE(f...)
do
 const gaspi return t r = f;
 if (r != GASPI SUCCESS)
     printf ("Error: '%s' [%s:%i]: %i\n", #f, FILE , LINE , r);\
     exit (EXIT FAILURE);
} while (0)
#endif
```

Timeout Mechanism

- Mechanism for potentially blocking procedures
 - procedure is guaranteed to return
- Timeout: gaspi_timeout_t
 - GASPI_TEST (0)
 - procedure completes local operations
 - Procedure does not wait for data from other processes
 - GASPI_BLOCK (-1)
 - wait indefinitely (blocking)
 - Value > 0
 - Maximum time in msec the procedure is going to wait for data from other ranks to make progress
 - != hard execution time

GASPI Process Management

- Initialize / Finalize
 - gaspi_proc_init
 - gaspi_proc_term
- Process identification
 - gaspi_proc_rank
 - gaspi_proc_num
- Process configuration
 - gaspi_config_get
 - gaspi_config_set

GASPI Initialization

gaspi_proc_init

```
gaspi_return_t
gaspi_proc_init ( gaspi_timeout_t const timeout )
```

- initialization of resources
 - set up of communication infrastructure if requested
 - set up of default group GASPI_GROUP_ALL
 - rank assignment
 - position in machinefile ⇔ rank ID
- no default segment creation

GASPI Finalization

gaspi_proc_term

```
gaspi_return_t
gaspi_proc_term ( gaspi_timeout_t timeout )
```

- clean up
 - wait for outstanding communication to be finished
 - release resources
- no collective operation!

GASPI Process Identification

gaspi_proc_rank

```
gaspi_return_t
gaspi_proc_rank ( gaspi_rank_t *rank )
```

gaspi_proc_num

```
gaspi_return_t
gaspi_proc_num ( gaspi_rank_t *proc_num )
```

GASPI Startup

gaspi_run

Usage:

gaspi_run -m <machinefile>[OPTIONS] <path2bin>

Available options:

-n procs>

-b
binary file> Use a different binary for master

-N Enable NUMA for procs on same node

Run with gdb on master node

 $-\circ$

Hello world - Hands on

Write a GASPI "Hello World" program which outputs

Hello world from rank xxx of yyy

- Use hands_on/helloworld.c as starting point
- Use SUCCESS_OR_DIE macro to check for return values
- Use the debug library (libGPI2-dbg.a)
- Execute the Hello World program and explore the several options of gaspi_run

GASPI "hello world"

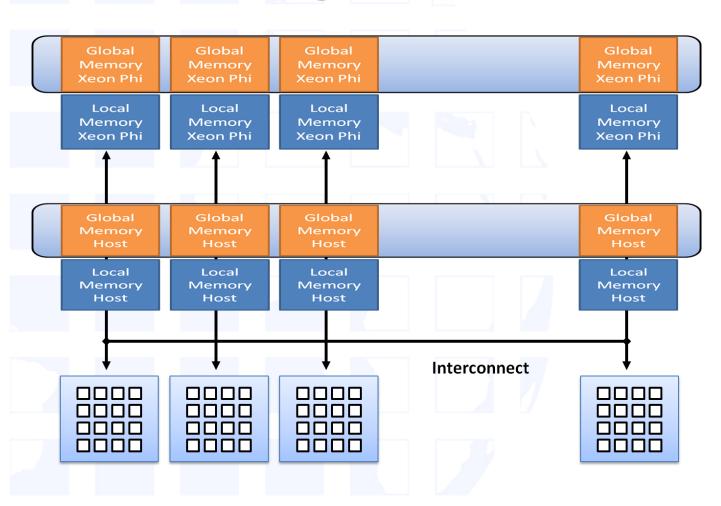

```
#include "success or die.h"
#include <GASPI.h>
#include <stdlib.h>
int main(int argc, char *argv[])
  SUCCESS OR DIE ( gaspi proc init (GASPI BLOCK) );
 gaspi rank t rank;
 gaspi rank t num;
  SUCCESS OR DIE ( gaspi proc rank (&rank) );
  SUCCESS OR DIE ( gaspi proc num (&num) );
 printf("Hello world from rank %d of %d\n", rank, num);
  SUCCESS OR DIE ( gaspi proc term (GASPI BLOCK) );
  return EXIT SUCCESS;
```

Memory Segments

Segments

Segments

- Software abstraction of hardware memory hierarchy
 - NUMA
 - GPU
 - Xeon Phi
- One partition of the PGAS
- Contiguous block of virtual memory
 - no pre-defined memory model
 - memory management up to the application
- Locally / remotely accessible
 - local access by ordinary memory operations
 - remote access by GASPI communication routines

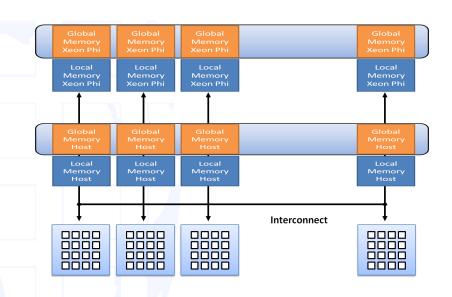

GASPI Segments

- GASPI provides only a few relatively large segments
 - segment allocation is expensive
 - the total number of supported segments is limited by hardware constraints
- GASPI segments have an allocation policy
 - GASPI_MEM_UNINITIALIZED
 - memory is not initialized
 - GASPI_MEM_INITIALIZED
 - memory is initialized (zeroed)

Segment Functions

- Segment creation
 - gaspi_segment_alloc
 - gaspi_segment_register
 - gaspi_segment_create
- Segment deletion
 - gaspi_segment_delete
- Segment utilities
 - gaspi_segment_num
 - gaspi_segment_ptr

GASPI Segment Allocation

gaspi_segment_alloc

- allocate and pin for RDMA
- Locally accessible
- gaspi_segment register

segment accessible by rank

GASPI Segment Creation

gaspi_segment_create

- Collective short cut to
 - gaspi_segment_alloc
 - gaspi_segment_register
- After successful completion, the segment is locally and remotely accessible by all ranks in the group

GASPI Segment with given Buffer

gaspi_segment_bind

```
gaspi_return_t gaspi_segment_bind
  ( gaspi_segment_id_t const segment_id
  , gaspi_pointer_t const pointer
  , gaspi_size_t const size
  , gaspi_memory_description_t const memory_description
)
```

- Binds a buffer to a particular segment
- Same capabilities as allocated/created segment
- Locally accessible (requires gaspi_segment_register)

GASPI Segment with given Buffer

gaspi_segment_use

```
gaspi_return_t gaspi_segment_use
  ( gaspi_segment_id_t const segment_id
  , gaspi_pointer_t const pointer
  , gaspi_size_t const size
  , gaspi_group_t const group
  , gaspi_timeout_t const timeout
  , gaspi_memory_description_t const memory_description
)
```

Equivalent to

```
GASPI_SEGMENT_USE (id, pointer, size, group, timeout, memory)
{
   GASPI_SEGMENT_BIND (id, pointer, size, memory);

   foreach (rank : group)
   {
      timeout -= GASPI_CONNECT (id, rank, timeout);
      timeout -= GASPI_SEGMENT_REGISTER (id, rank, timeout);
   }

   GASPI_BARRIER (group, timeout);
}
```

GASPI Segment Deletion

gaspi_segment_delete

```
gaspi_return_t
gaspi_segment_delete ( gaspi_segment_id_t segment_id )
```

Free segment memory

GASPI Segment Utils

gaspi_segment_num

```
gaspi_return_t
gaspi_segment_num ( gaspi_number_t *segment_num )
```

gaspi_segment_list

```
gaspi_return_t
gaspi_segment_list ( gaspi_number_t num
, gaspi_segment_id_t *segment_id_list )
```

gaspi_segment_ptr

GASPI Segment Utils

gaspi_segment_max

```
gaspi_return_t
gaspi_segment_max (gaspi_number_t *segment_max)
```

- Maximum number of segments
- Defines range of allowed segment IDs [0,segment_max - 1)

Using Segments - Hands on

 Write a GASPI program which stores a NxM matrix in a distributed way: 1 row per process

	0	1	 M-1
l	M	M+1	 2M-1
l			
	(N-1)M	(N-1)M+1	 NM-1

- Create a segment
- Initialize the segment

Row 0 Row 1

Row N-1

output the result

Using Segments (I)

```
// includes
int main(int argc, char *argv[])
   static const int VLEN = 1 << 2;
   SUCCESS OR DIE ( gaspi proc init (GASPI BLOCK) );
   gaspi rank t iProc, nProc;
   SUCCESS OR DIE ( gaspi proc rank (&iProc));
   SUCCESS OR DIE ( gaspi proc num (&nProc));
   gaspi segment id t const segment id = 0;
   SUCCESS OR DIE ( gaspi segment create ( segment id, segment size
                                     , GASPI GROUP ALL, GASPI BLOCK
                                     , GASPI MEM UNINITIALIZED ) );
```

Using Segments (II)

One-sided Communication

GASPI One-sided Communication

gaspi_write

 Post a put request into a given queue for transfering data from a local segment into a remote segment

GASPI One-sided Communication

gaspi_read

 Post a get request into a given queue for transfering data from a remote segment into a local segment

GASPI One-sided Communication

gaspi_wait

- Wait on local completion of all requests in a given queue
- After successfull completion, all involved local buffers are valid

Queues (I)

- Different queues available to handle the communication requests
- Requests to be submitted to one of the supported queues
- Advantages
 - More scalability
 - Channels for different types of requests
 - Similar types of requests are queued and synchronized together but independently from other ones
 - Separation of concerns
 - Asynchronous execution, thin abstraction of HW queues.

Queues (II)

- Fairness of transfers posted to different queues is guaranteed
 - No queue should see ist communication requests delayed indefinitely
- A queue is identified by its ID
- Synchronization of calls by the queue
- Queue order does not imply message order on the network / remote memory
- A subsequent notify call is guaranteed to be nonovertaking for all previous posts to the same queue and rank

Queues (III)

- Queues have a finite capacity
- Queues are not automatically flushed
 - Maximize time between posting the last request and flushing the queue (qwait)
- Return value GASPI_QUEUE_FULL indicates full queue.

GASPI Queue Utils

gaspi_queue_size

gaspi_queue_size_max

```
gaspi_return_t
gaspi_queue_size_max ( gaspi_number_t* queue_size_max )
```

GASPI Queue Utils

gaspi_queue_num

```
gaspi_return_t
gaspi_queue_num (gaspi_number_t *queue_num)
```

gaspi_queue_max

```
gaspi_return_t
gaspi_queue_max ( gaspi_number_t queue_max )
```

GASPI Queue Utils

gaspi_queue_create

gaspi_queue_delete

```
gaspi_return_t
gaspi_queue_delete ( gaspi_queue_id_t queue )
```

write_and_wait

- serial wait on queue
- sanity checks

```
void
write and wait ( gaspi segment id t const segment id local
               , gaspi_offset_t const offset_local
               , gaspi rank t const rank
               , gaspi segment id t const segment id remote
               , gaspi_offset_t const offset_remote
               , gaspi_size_t const size
                 gaspi queue id t const queue
  gaspi_timeout_t const timeout = GASPI_BLOCK;
  gaspi return t ret;
  /* write, wait if required and re-submit */
  while ((ret = ( gaspi write( segment id local, offset local, rank,
                               segment id remote, offset remote, size,
                               queue, timeout)
            )) == GASPI QUEUE FULL)
      SUCCESS_OR_DIE (gaspi_wait (queue,
                                  GASPI BLOCK));
  ASSERT (ret == GASPI_SUCCESS);
```

write_notify_and_cycle

- cycle through queues
- sanity checks

```
void
write_notify_and_cycle ( gaspi_segment_id_t const segment_id_local
                       , gaspi offset t const offset local
                       , gaspi_rank_t const rank
                       , gaspi segment id t const segment id remote
                       , gaspi_offset_t const offset_remote
                       , gaspi size t const size
                       , gaspi notification id t const notification id
                         gaspi notification t const notification value
  gaspi number t queue num;
  SUCCESS_OR_DIE(gaspi_queue_num (&queue_num));
  gaspi_timeout_t const timeout = GASPI_BLOCK;
  gaspi return t ret;
  /* write, cycle if required and re-submit */
  while ((ret = ( gaspi_write_notify( segment_id_local, offset_local, rank,
                                      segment id remote, offset remote, size,
                                      notification_id, notification_value,
                                      my queue, timeout)
                  )) == GASPI_QUEUE_FULL)
      my_queue = (my_queue + 1) % queue_num;
      SUCCESS OR DIE (gaspi wait (my queue,
                                  GASPI_BLOCK));
 ASSERT (ret == GASPI_SUCCESS);
```

wait_for_flush_queues

flush all queues

Data Synchronization By Notification

- One sided-communication:
 - Entire communication managed by the local process only
 - Remote process is not involved
 - Advantage: no inherent synchronization between the local and the remote process in every communication request
- Still: At some point the remote process needs knowledge about data availability
 - Managed by notification mechanism

- Several notifications for a given segment
 - Identified by notification ID
 - Logical association of memory location and notification

gaspi_notify

- Posts a notification with a given value to a given queue
- Remote visibility guarantees remote data visibility of all previously posted writes in the same queue, the same segment and the same process rank

gaspi_notify_waitsome

- Monitors a contiguous subset of notification id's for a given segment
- Returns successfull if at least one of the monitored id's is remotely updated to a value unequal zero

gaspi_notify_reset

Atomically resets a given notification id and yields
 the old value

wait_or_die

- Wait for a given notification and reset
- Sanity checks

```
include "waitsome.h"
#include "assert.h"
#include "success_or_die.h"
void wait_or_die
 ( gaspi_segment_id_t segment_id
  , gaspi_notification_id_t notification_id
  gaspi notification texpected
 gaspi_notification_id_t id;
 SUCCESS OR DIE
  (gaspi_notify_waitsome (segment_id, notification_id, 1, &id, GASPI_BLOCK));
 ASSERT (id == notification_id);
 gaspi notification t value;
 SUCCESS_OR_DIE (gaspi_notify_reset (segment_id, id, &value));
 ASSERT (value == expected);
```

test_or_die

- Test for a given notification and reset
- Sanity checks

```
#include "assert.h"
#include "success_or_die.h"
nt test or die
 (gaspi segment id t segment id
 , gaspi notification id t notification id
 , gaspi_notification_t expected
 gaspi_notification_id_t id;
 gaspi_return_t ret;
if ( ( ret =
     gaspi_notify_waitsome (segment_id, notification_id, 1, &id, GASPI_TEST)
    ) == GASPI SUCCESS
  ASSERT (id == notification_id);
  gaspi_notification_t value;
  SUCCESS_OR_DIE (gaspi_notify_reset (segment_id, id, &value));
  ASSERT (value == expected);
  return 1;
 else
  ASSERT (ret != GASPL ERROR);
  return 0;
```

Extended One-sided Calls

- gaspi_write_notify
 - write + subsequent gaspi_notify, unordered with respect to "other" writes.
- gaspi_write_list
 - several subsequent gaspi_writes to the same rank
- gaspi_write_list_notify
 - gaspi_write_list + subsequent gaspi_notify, non-ordered with respect to "other" writes.
- gaspi_read_list
 - Several subsequent read from the same rank.
- gaspi_read_notify
 - read + subsequent gaspi_notify, unordered with respect to "other" writes.

gaspi_write_notify

- gaspi_write with subsequent gaspi_notify
- Unordered relative to other communication (!)

gaspi_write_list

Several subsequent gaspi_write

gaspi_write_list_notify

- several subsequent gaspi_write and a notification
- Unordered relative to other communication (!)

gaspi_read_list

several subsequent gaspi_read

gaspi_read_notify

```
GASPI_READ_NOTIFY ( segment_id_local , offset_local , rank , segment_id_remote , offset_remote , size , notification_id , queue , timeout )
```

- "gaspi_read with subsequent gaspi_notify"
- Unordered relative to other communication (!)

Communication – Hands on

 Take your GASPI program which stores a NxM matrix in a distributed way and extend it by communication for rows

0		1	 M-1
М		M+1	 2M-1
(N	-1)M	(N-1)M+1	 NM-1

- Create a segment (sufficient size for a source and target row)
- Initialize the segment

Row 0

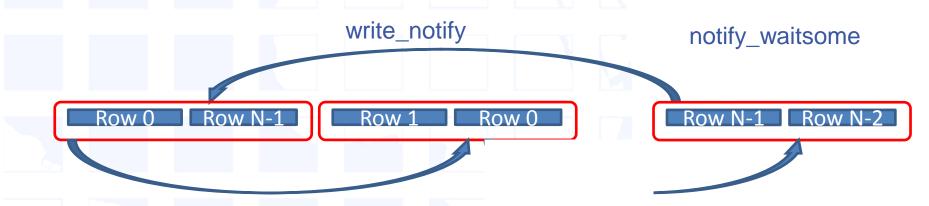

Row 1

Row N-1

Communication – Hands on

- Take your GASPI program which stores a NxM matrix in a distributed way and extend it by communication
 - Communicate your row to your right neighbour (periodic BC)

- Check that the data is available
- Output the result

onesided.c (I)

```
// includes
int main(int argc, char *argv[])
 static const int VLEN = 1 << 2;
 SUCCESS OR DIE ( gaspi proc init (GASPI BLOCK) );
 gaspi rank t iProc, nProc;
 SUCCESS OR DIE ( gaspi proc rank (&iProc));
 SUCCESS OR DIE ( gaspi proc num (&nProc));
 gaspi segment id t const segment id = 0;
 SUCCESS OR DIE ( gaspi segment create ( segment id, segment size
                                     , GASPI GROUP ALL, GASPI BLOCK
                                     , GASPI MEM UNINITIALIZED ) );
 gaspi pointer t array;
 SUCCESS OR DIE ( gaspi segment ptr (segment id, &array) );
 double * src array = (double *)(array);
 double * rcv array = src array + VLEN;
 for (int j = 0; j < VLEN; ++j) {
   src array[j] = (double) ( iProc * VLEN + j ); }
```

```
Add
Proc
GAS

(* write, cycle if required and re-submit */
while ((ret = ( gaspi_write_notify( segment_id_local, offset_local, rank, segment_id_remote, offset_remote, size, notification_id, notification_value, my_queue, timeout)

(*) ) == GASPI_QUEUE_FULL) {

my_queue = (my_queue + 1) % queue_num;

SUCCESS_OR_DIE (gaspi_wait (my_queue, GASPI_BLOCK));

}

ASSERT (ret == GASPI_SUCCESS);
```

```
gaspi notification id t data available = 0;
gaspi offset t loc off = 0;
gaspi offset t rem off = VLEN * sizeof (double);
write notify and cycle ( segment id
                         , loc off
                         , RIGHT (iProc, nProc)
                         , segment id
                         , rem off
                         , VLEN * sizeof (double)
                         , data available
                         1 + iProc
wait or die (segment id, data available, 1 + LEFT (iProc, nProc) );
for (int j = 0; j < VLEN; ++j)
{ printf("rank %d rcv elem %d: %f \n", iProc,j,rcv array[j] ); }
wait for flush queues();
SUCCESS OR DIE ( gaspi proc term (GASPI BLOCK) );
return EXIT SUCCESS; }
```

Collective Operations (I)

- Collectivity with respect to a definable subset of ranks (groups)
 - Each GASPI process can participate in more than one group
 - Defining a group is a three step procedure
 - gaspi_group_create
 - gaspi_group_add
 - gaspi_group_commit
 - GASPI_GROUP_ALL is a predefined group containing all processes

Collective Operations (II)

- All gaspi processes forming a given group have to invoke the operation
- In case of a timeout (GASPI_TIMEOUT), the operation is continued in the next call of the procedure
- A collective operation may involve several procedure calls until completion
- Completion is indicated by return value GASPI_SUCCESS

Collective Operations (III)

- Collective operations are exclusive per group
 - Only one collective operation of a given type on a given group at a given time
 - Otherwise: undefined behaviour
- Example
 - Two allreduce operations for one group can not run at the same time
 - An allreduce operation and a barrier are allowed to run at the same time

Collective Functions

- Built in:
 - gaspi_barrier
 - gaspi_allreduce
 - GASPI_OP_MIN, GASPI_OP_MAX, GASPI_OP_SUM
 - GASPI_TYPE_INT, GASPI_TYPE_UINT, GASPI_TYPE_LONG, GASPI_TYPE_ULONG, GASPI_TYPE_FLOAT, GASPI_TYPE_DOUBLE
- User defined
 - gaspi_allreduce user

GASPI Collective Function

gaspi_barrier

gaspi_allreduce

Passive communication

Passive Communication Functions (I)

- 2 sided semantics send/recv
 - gaspi_passive_send

time based blocking

Passive Communication Functions (II)

– Gaspi_passive receive

- Time based blocking
- Sends calling thread to sleep
- Wakes up calling thread in case of incoming message or given timeout has been reached

Passive Communication Functions (III)

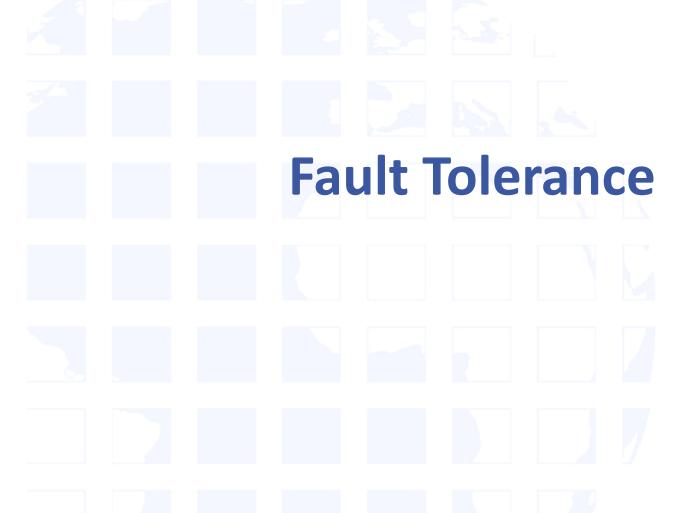

- Higher latency than one-sided comm.
 - Use cases:
 - Parameter exchange
 - management tasks
 - "Passive" Active Messages (see advanced tutorial code)
 - GASPI Swiss Army Knife.

Passive Communication Functions (III)

```
void *handle passive(void *arg)
 gaspi pointer t vptr;
  SUCCESS OR DIE (gaspi segment ptr (passive segment, & vptr));
  const gaspi offset t passive offset = sizeof(packet);
 while (1)
      gaspi rank t sender;
      SUCCESS OR DIE (gaspi passive receive (passive segment
                                            , passive offset
                                            , &sender
                                            , sizeof(packet)
                                            , GASPI BLOCK
      packet *t = (packet *) ((char*) vptr + sizeof(packet));
      return offset(t->rank, t->len, t->offset)
return NULL;
```

Features

- Implementation of fault tolerance is up to the application
- But: well defined and requestable state guaranteed at any time by
 - Timeout mechanism
 - Potentially blocking routines equipped with timeout
 - Error vector
 - contains health state of communication partners
 - Dynamic node set
 - substitution of failed processes

Interoperability with MPI

Interoperability with MPI

- GASPI supports interoperability with MPI in a so-called mixed-mode.
- The mixed-mode allows for
 - either entirely porting an MPI application to GASPI
 - or replacing performance-critical parts of an MPI based application with GASPI code (useful when dealing with large MPI code bases)
- Porting guides available at:

http://www.gpi-site.com/gpi2/docs/whitepapers/

Mixing GASPI and MPI in Parallel Programs

- GASPI must be installed with MPI support, using the option
 - --with-mpi <path_to_mpi_installation>
- MPI must be initialized before GASPI, as shown in the joined example
- The same command or script as the one provided by the MPI installation should be used for starting programs (mpirun or similar)
- gaspi_run should not be used!

```
#include <assert.h>
#include <GASPI.h>
#include <mpi.h>
int main (int argc, char *argv[])
  // initialize MPI and GASPI
 MPI Init (&argc, &argv);
 gaspi proc init (GASPI BLOCK);
  // Do work ...
  // shutdown GASPI and MPI
  gaspi proc term (GASPI BLOCK);
 MPI Finalize();
  return 0;
```

GASPI Preserves the MPI Ranks

- GASPI is able to detect at runtime the MPI environment and to setup its own environment based on this
- GASPI can deliver the same information about ranks and number of processes as MPI
- This helps to preserve the application logic

```
int nProc MPI, iProc MPI;
gaspi rank t iProc, nProc;
MPI Init(&argc, &argv);
MPI Comm rank (MPI COMM WORLD, &iProc MPI);
MPI Comm size (MPI COMM WORLD, &nProc MPI);
SUCCESS OR DIE (gaspi proc ini(GASPI BLOCK));
SUCCESS OR DIE (gaspi proc rank (&iProc));
SUCCESS OR DIE (gaspi proc_num (&nProc));
ASSERT (iProc == iProc MPI);
ASSERT (nProc == nProc MPI);
```

Using User Provided Memory for Segments

- New feature added in version 1.3 of GASPI: a user may provide already allocated memory for segments
- Memory used in MPI communication can be used in GASPI communication
- However, the feature should be used with care because the segment creation is an expensive operation

```
//initialize and allocate memory
double *buffer = calloc ( num elements
                         , sizeof(double)
gaspi segment id t segment id = 0;
//use the allocated buffer as underlying
//memory support for a segment
SUCCESS OR DIE
  ( gaspi segment use
  , segment id
  , buffer
  , n*sizeof (double)
  , GASPI GROUP ALL
  , GASPI BLOCK
  );
```

Using GASPI Segment Allocated Memory in MPI Communication

Mixing MPI Code with GASPI Code From a Library

- In mixed-mode, an MPI based code may call GASPI code that is embedded into a library
- The GASPI environment must be initialized and cleaned up within the calling program

```
int n, my mpi rank, n mpi procs;
MPI Init (&argc, &argv);
MPI Comm rank (MPI COMM WORLD, &my mpi rank);
MPI Comm size (MPI COMM WORLD, &n mpi procs);
SUCCESS OR DIE (gaspi proc init, GASPI BLOCK);
// initialize data
// distribute data, do MPI communication
// call GPI library function for iteratively
// solving a linear system
Gaspi Jacobi (n, n local rows, local a,
         , local b, &x, x new, n max iter, tol
         );
SUCCESS OR DIE (gaspi proc term, GASPI BLOCK);
MPI Finalize();
```

Interoperability - Hands on

- Implement allgatherV
- Local array size
 M_SZ*2^(rank)

```
// init MPI/GASPI
int const B SZ = 2;
int const M SZ = 2048;
int *offset = malloc(nProc * sizeof(int));
ASSERT (offset != NULL);
int *size = malloc(nProc * sizeof(int));
ASSERT (size != NULL);
int vlen = 0;
int i, k = 1;
for (i = 0; i < nProc; ++i)
   offset[i] = vlen;
    size[i] = M_SZ * k;
   vlen += size[i];
     *= B SZ;
```

Interoperability - Hands on - II

- 1. Modify the above MPI program, such that the GASPI environment is initialized after MPI
- 2. Check if the MPI ranks and GASPI ranks are identical
- 3. Create a GASPI segment
- 4. Use GASPI segment allocated memory as a communication buffer in the MPI allgatherV operation

The GASPI programming model

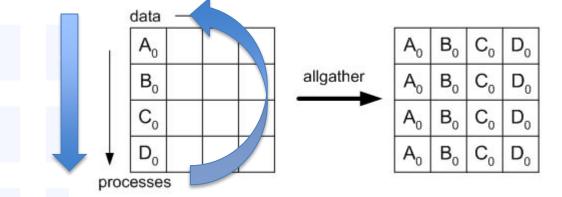

Asynchronous execution with maximal overlap of communication and computation

THINK PERFORMANCE

Example: allgatherV

 Complete the ,folklore' round-robin algorithm (TODO + Questions)

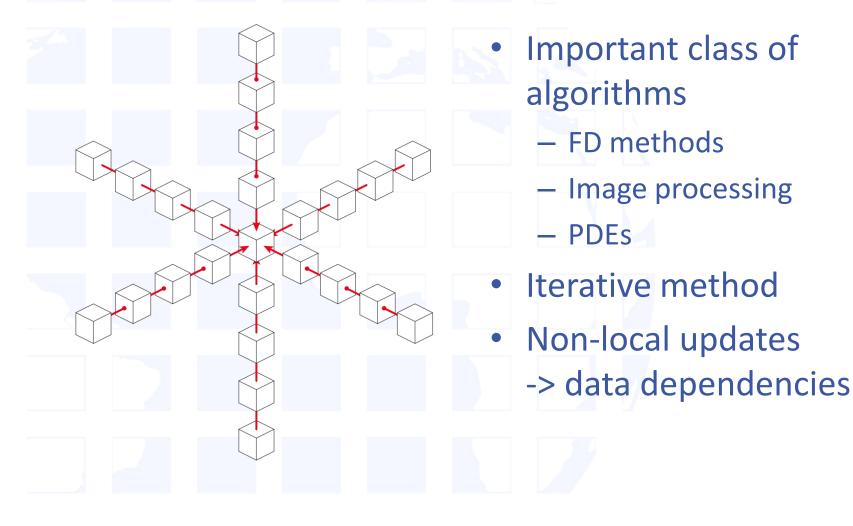

Example: allgatherV

- Complete the ,pipelined' algorithm, allscatter
 - + broadcast (TODO + Questions)

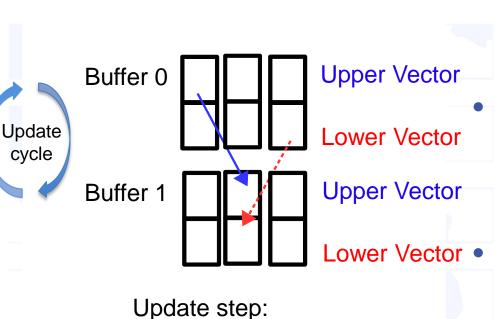

Example: Stencil applications

cycle

Stencil application proxy

- Update upper part

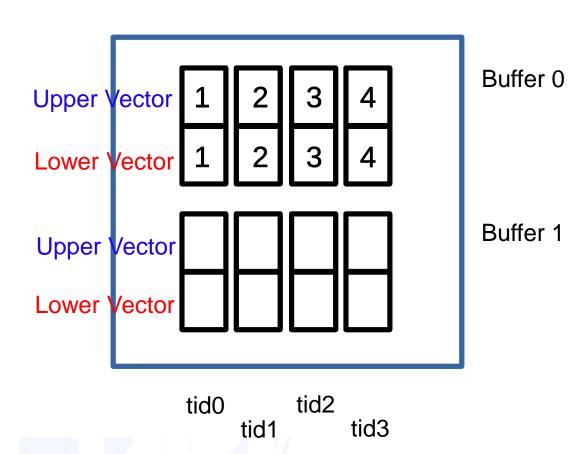

- Update lower part

- 2 buffers per element
 - Buffer 0
 - Buffer 1
- 2 vectors per buffer
 - Upper vector
 - Lower vector
- Data dependencies
 - Left element
 - Right element

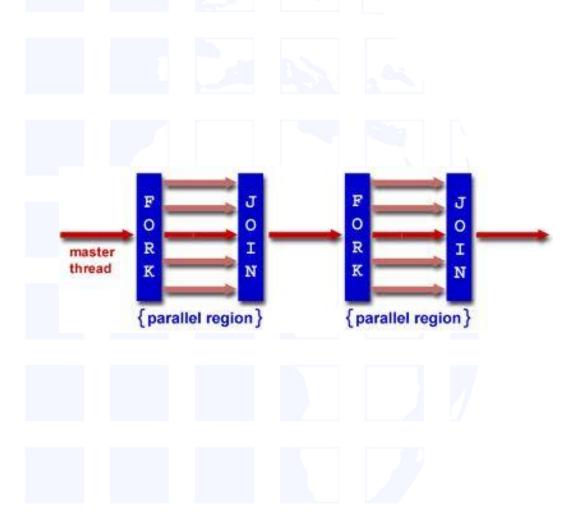

Stencil application proxy

- Nthread omp threads
- static domain decomposition / assignment
- Two buffers per thread
- Two vectors per buffer
- Vector length: nvector

Fork-Join model

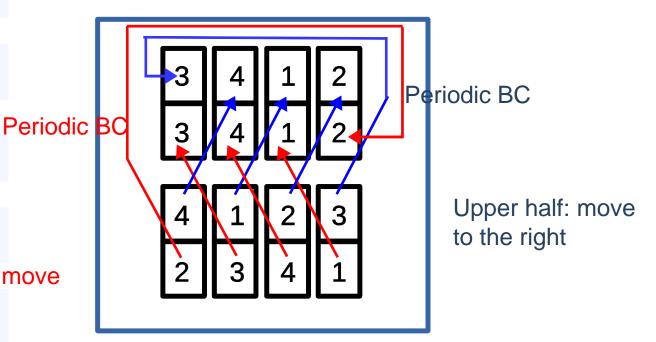

Lower half: move to the left

Upper half: move to the right

1 2 3 4
1 2 3 4
Periodic BC

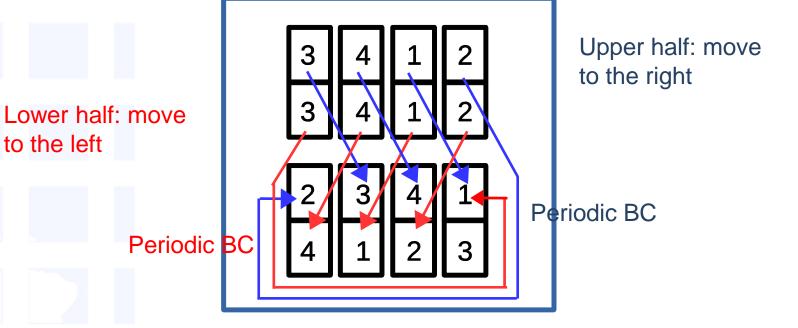

Periodic BC

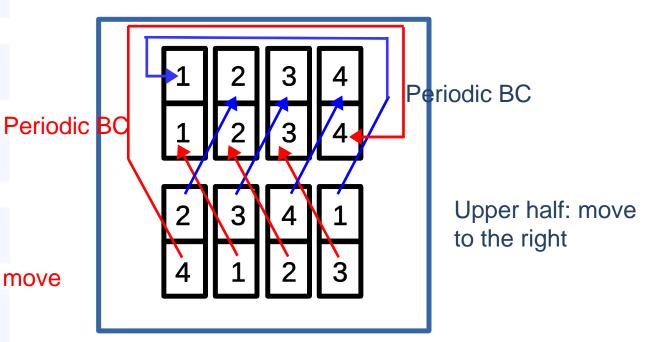

Lower half: move to the left

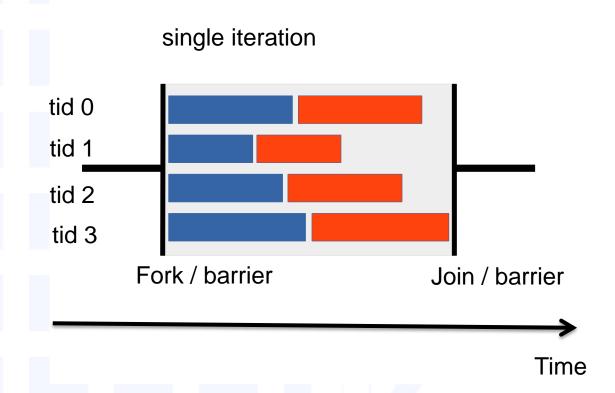

Lower half: move to the left

- Nelem many iterations:
 - Initial configuration recovered
 - -> Easy to check

Temporal evolution

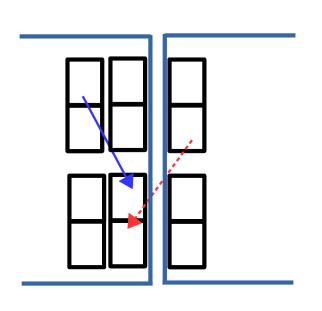

MORE THAN ONE PROCESS ...

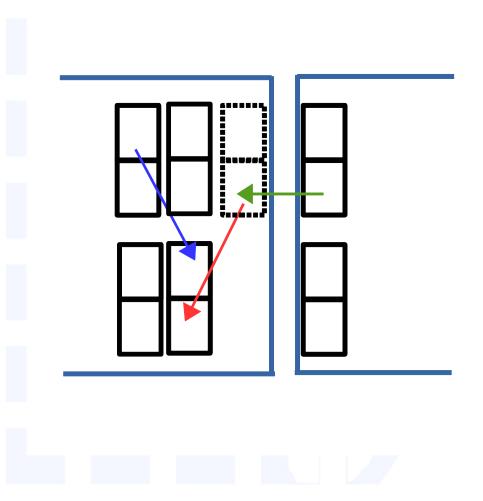

Elementary update

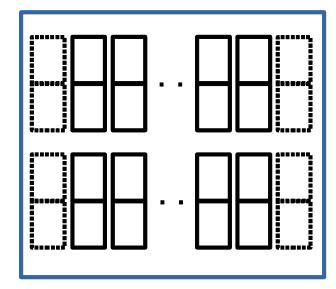

- Each process hosts some part of the information
- Part of the information is no longer directly accessible

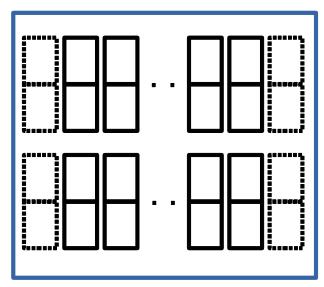

Boundary / Halo domains

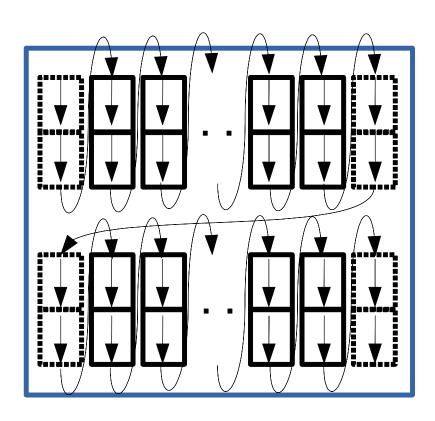

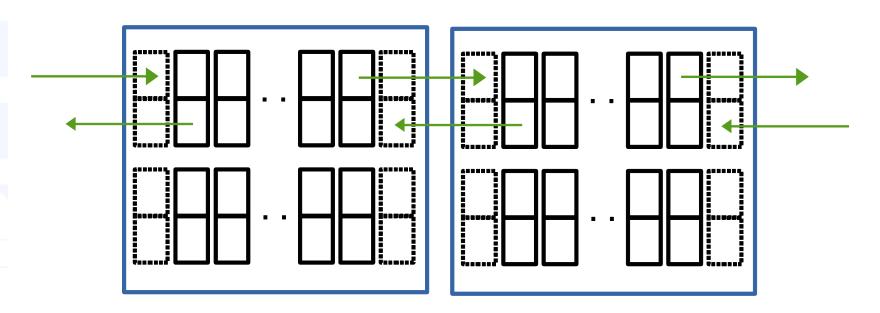

BULK SYNCHRONOUS

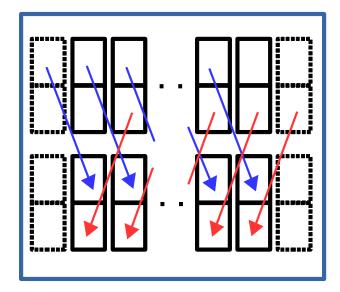

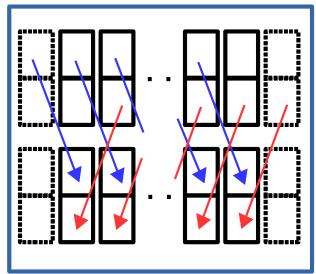

Communication phase

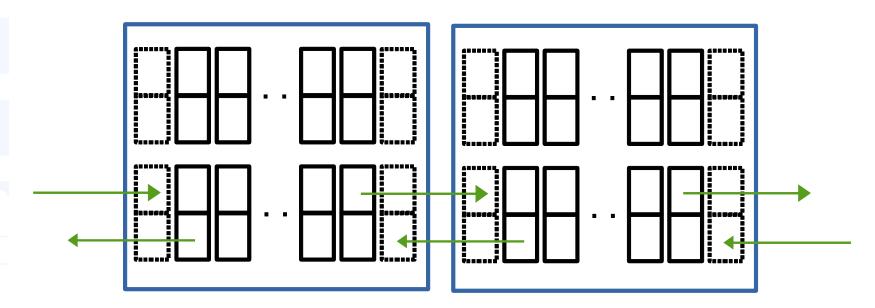

Computation phase

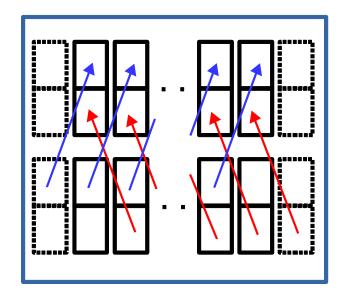

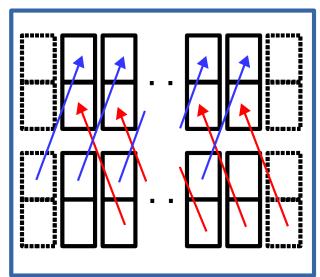

Communication phase

Computation phase

Hands-on

- Implement the bulk-synchronous algorithm
 - use left_right_double_buffer_funneled.c as template

The GASPI Ring Exchange

GASPI – left_right_double_buffer_funneled.c

```
if (tid == 0) {
   // issue write
   write_notify_and_cycle
   (.., LEFT(iProc, nProc),., right_data_available[buffer_id], 1 + i);
   // issue write
   write_notify_and_cycle
   (.., RIGHT(iProc, nProc),., left_data_available[buffer_id], 1 + i);
   }
   #pragma omp barrier
   data_compute ( NTHREADS, array, 1 - buffer_id, buffer_id, slice_id);
   #pragma omp barrier
   buffer_id = 1 - buffer_id;
```

Basic ingredients

EXCURSION: EFFICIENT PARALLEL EXECUTION

Efficient parallel execution

 Question: What is the measure for "efficient parallel execution"?

Efficient parallel execution

 Question: What is the measure for "efficient parallel execution"?

SCALABILITY

Scalability S

- Definition: $S(N_{proc}) = \frac{T(1)}{T(N_{proc})}$
- Interpretation:

Measure for the additional benefit generated by employing additional resources

Scalability S

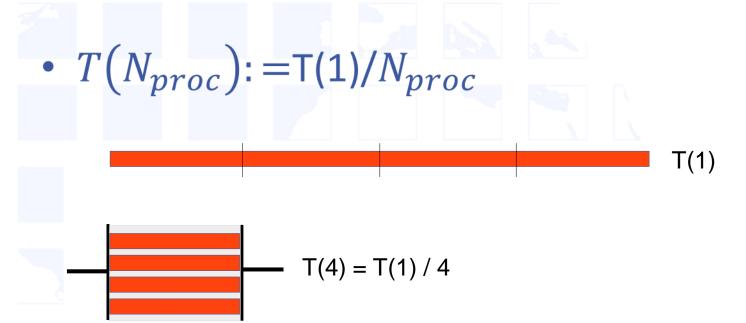

Optimal: linear scalability, i.e.

$$T(N_{proc}) = T(1)/N_{proc}$$

 doubling the resources implies doubling the generated benefit

Implications for parallelization

Implications for parallelization

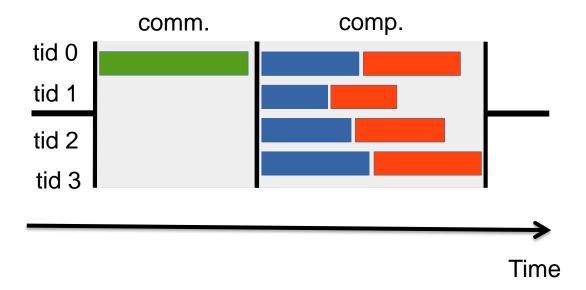

- $T(N_{proc}):=T(1)/N_{proc}$
- T(1) is pure computation time, i.e.
 - communication latencies need to be completely hidden by the parallel implementation
 - Optimal load balancing is required
 - No synchronization points
 (Potential aggregation of imbalances, imbalances are per se unavoidable, e.g. OS jitter etc.)

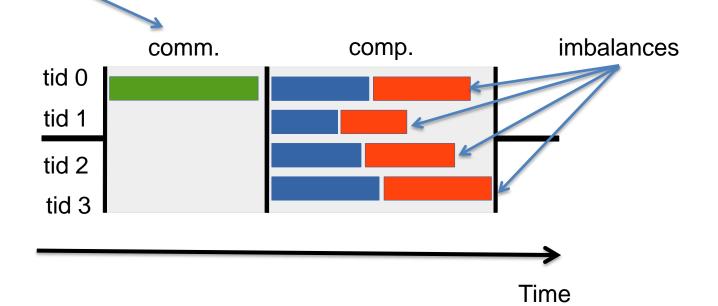

Temporal evolution: one iteration

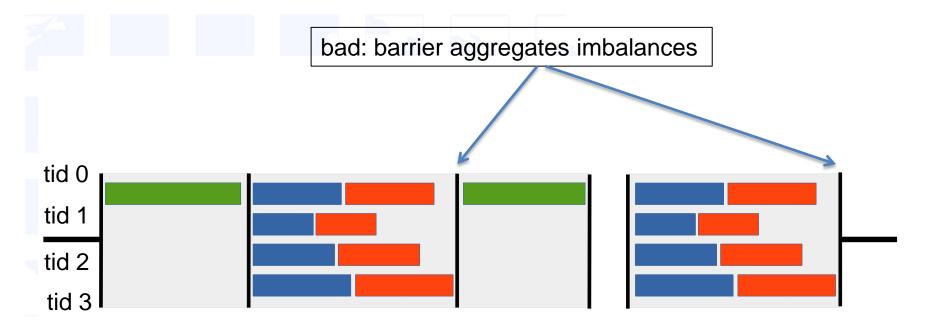

Temporal evolution: one iteration

bad: explicitly visible communication latency

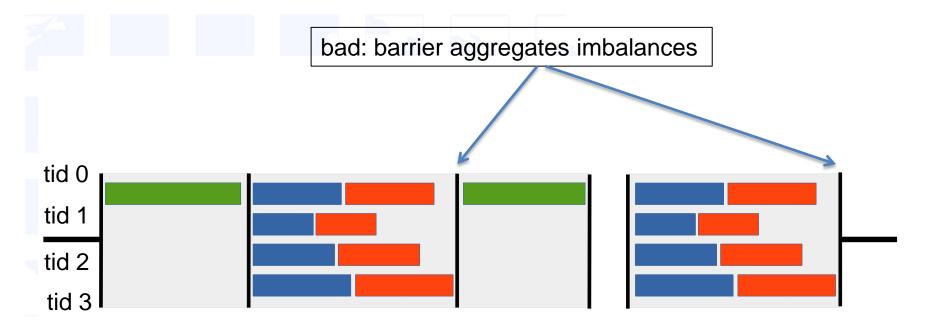

Temporal evolution: all iterations

Temporal evolution: all iterations

Hide communication behind computation

COMMUNICATION / COMPUTATION OVERLAP

Strategy

- Hide communication latencies behind computation
- Split data into inner / boundary part
 - Inner data ⇔ no dependence on remote information
 - Boundary data ⇔ has dependence on remote information

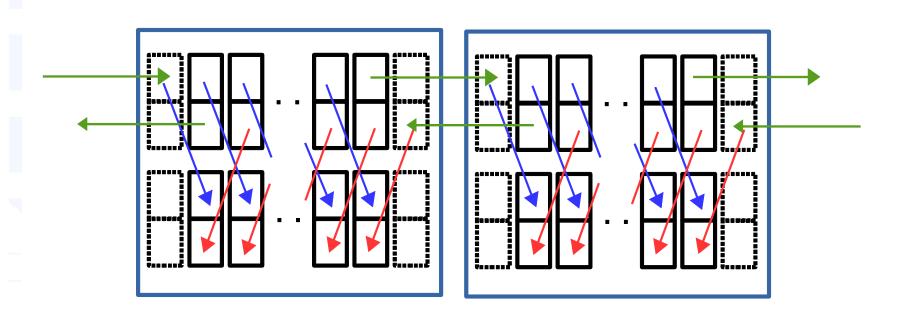

Strategy

- Algorithmic phases:
 - Init boundary data transfer
 - Update inner data along data transfer
 - Update boundary data

Single iteration

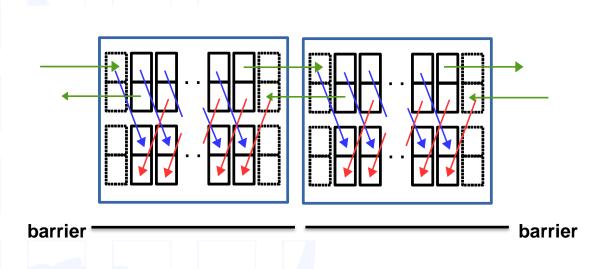

barrier — barrier

Single iteration: details

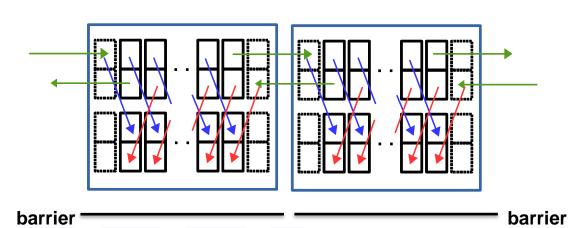

Left boundary element:

Initiate boundary data transfer to remote halo

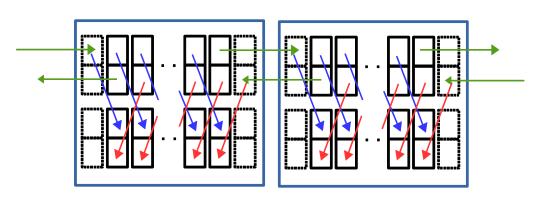

- 1. Initiate boundary data transfer to remote halo
- Wait for boundary data transfer to local halo completion

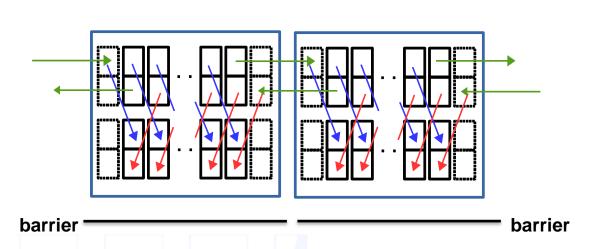

- 1. Initiate boundary data transfer to remote halo
- Wait for boundary data transfer to local halo completion
- 3. Update vector

barrier barrier

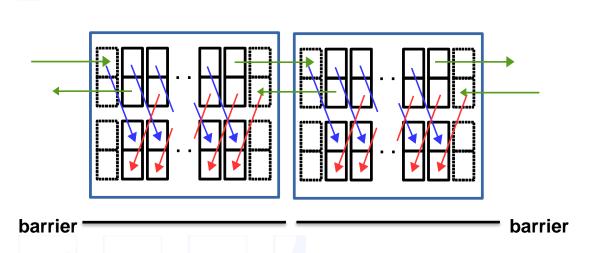

- 1. Initiate boundary data transfer to remote halo
- Wait for boundary data transfer to local halo completion
- 3. Update vector
- -> Right boundary element handled analogously

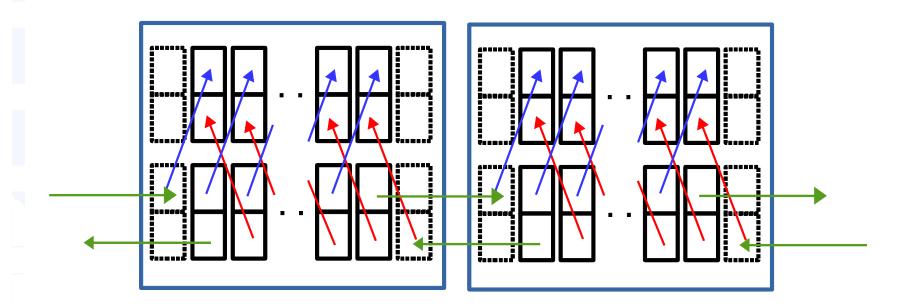

- Initiate boundary data transfer to remote halo
- Wait for boundary data transfer to local halo completion
- 3. Update vector
- -> Right boundary element handled analogously

In the meanwhile inner elements are done in parallel!

Single iteration

barrier — barrier

Hands-on

- Implement the overlap of communication and computation
 - use left_right_double_buffer_multiple.c as template

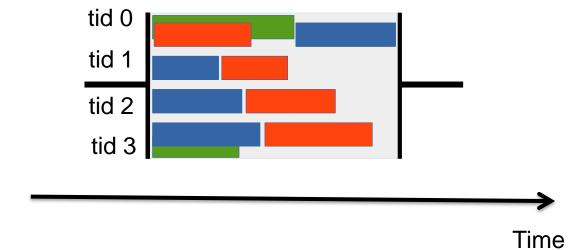

The GASPI Ring Exchange

GASPI – left_right_double_buffer_multiple.c

```
if (tid == 0) {
write notify and cycle
  ( .., LEFT(iProc, nProc), . , right data available[buffer id], 1 + i);
 wait or die (segment id, left data available[buffer id], 1 + i);
 data compute (NTHREADS, array, 1 - buffer id, buffer id, slice id);
else if (tid < NTHREADS - 1) {
  data compute ( NTHREADS, array, 1 - buffer id, buffer id, slice id);
else {
write notify and cycle
  ( .., RIGHT(iProc, nProc),., left data available[buffer id], 1 + i);
 wait or die (segment id, right data available[buffer id], 1 + i);
 data compute (NTHREADS, array, 1 - buffer id, buffer id, slice id);
#pragma omp barrier
buffer id = 1 - buffer id;
```

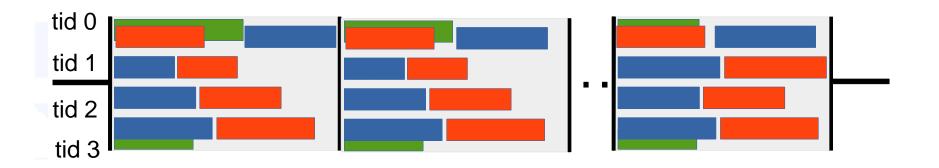

Temporal evolution

Temporal evolution

Time

Avoid synchronization point

DATA DEPENDENCY DRIVEN

- What has been achieved?
 - Overlap of communication by computation
 - Communication latency is (partly) hidden
- What has not been achieved?
 - Fully Asynchronous execution
 - Still processwide synchronization after each iteration
 - -> process wide aggregation of thread imbalances

- Why barrier?
 - Need to know that buffers are ready for next iteration

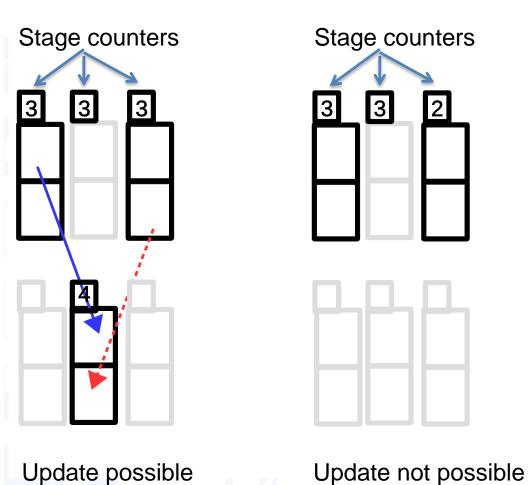

- Barrier provides too much information !!!
 - Only need to know that local neighbours (my dependency) are up to date

Reduce synchronicity

- Introduce stage counter for every buffer to account for local states
- check neighbourig stage counters before update
- In case of match: do update
- Increment stage counter after update
- -> Only local dependencies remain

Avoid static assignment thread / subdomain

- 1 "Task" for each subdomain
 - Compute task for inner subdomain
 - Compute Initiate data transfer task for boundary subdomains
- Pre-Condition check before execution
 - Left / right neighbor element are do not have a higher iteration counter than me
- Post-Condition set after execution
 - Increment iteration counter

The GASPI Ring Exchange

GASPI – Dataflow - left_right_dataflow_halo.c

```
#pragma omp parallel default (none) firstprivate (buffer id, queue id)
  shared (array, data available, ssl, stderr)
    slice* sl;
    while (sl = get slice and lock (ssl, NTHREADS, num))
      handle slice(sl, array, data available, segment id, queue id,
        NWAY, NTHREADS, num);
      omp unset lock (&sl->lock);
                    typedef struct slice t
                      omp lock t lock;
                     volatile int stage;
                      int index;
                     enum halo types halo type;
                      struct slice t *left;
                      struct slice t *next;
```

slice;

Hands-on

- Implement the data dependency driven algorithm
 - use slice.c as template
 - use left_right_dataflow.c as template

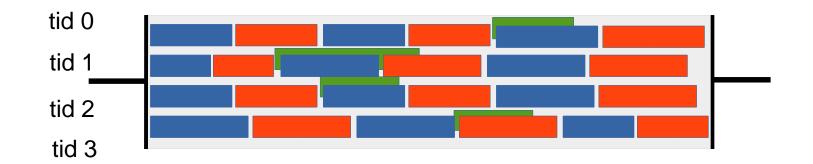

The GASPI Ring Exchange

GASPI – Dataflow - slice.c

```
void handle slice ( ...)
 if (sl->halo type == LEFT) {
    if (sl->stage > sl->next->stage) {return;}
    if (! test or die (segment id, left data available[old buffer id], 1))
    { return; }
  } else if (sl->halo type == RIGHT) {
    if (sl->stage > sl->left->stage) { return; }
    if (! test or die (segment id, right data available[old buffer id], 1))
    { return; }
  } else if (sl->halo type == NONE) {
    if (sl->stage > sl->left->stage || sl->stage > sl->next->stage) {return;}
  data compute (NTHREADS, array, new buffer id, old buffer id, sl->index);
  if (sl->halo type == LEFT) {
    write notify and cycle(..);
  } else if (sl->halo type == RIGHT)
    write notify and cycle(..);
 ++sl->stage;
```

Temporal evolution

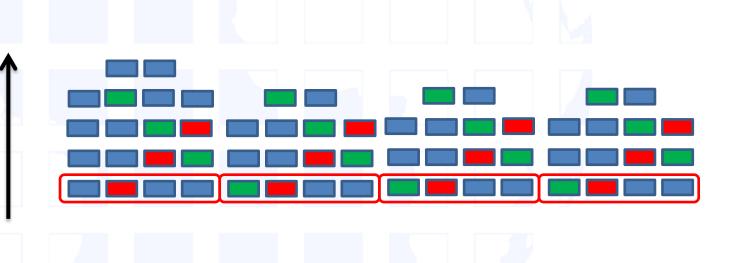

Time

The GASPI Ring Exchange

GASPI - Dataflow

Locally and globally asynchronous dataflow.

Task (Graph) Models

Bottom up: Complement local task dependencies with remote data dependencies.

Task (Graph) Models

Targets

- Node local execution on (heterogeneous) manycore architectures.
- Scalability issues in Fork-Join models
- Vertically fragmented memory, separation of access and execution, handling of data marshalling, tiling, etc.
- Inherent node local load imbalance

GASPI

Targets:

- Latency issues, overlap of communication and computation.
- Asynchronous fine-grain dataflow model
- Fault tolerance, system noise, jitter.

Top Down: Reformulate towards asynchronous dataflow model.

Overlap communication and computation.
